

# GETTY COPPER

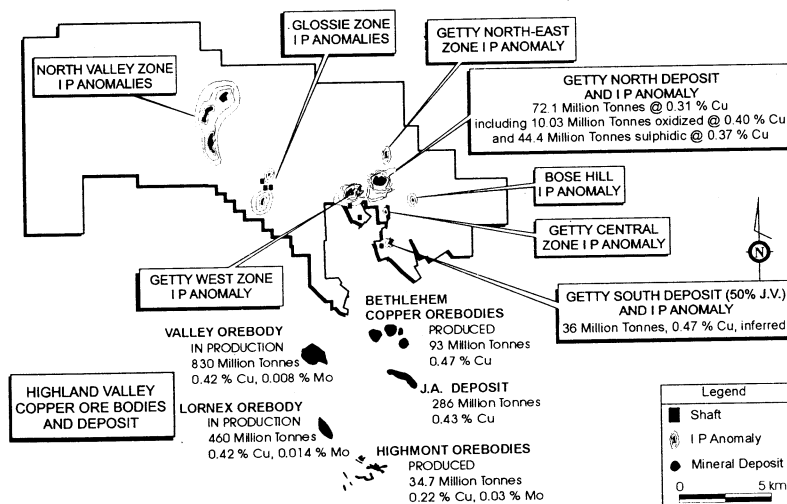

Getty Copper Corp. is aggressively exploring and developing a 210-sq-km property located in the copper-rich Highland Valley, the premier porphyry copper mining region of British Columbia. The Company's property is adjacent to the huge Highland Valley Copper Partnership (Cominco, Rio Algom and Teck) which to date has produced 8.2 billion pounds of copper from 830 million tonnes of ore. Getty's program since 1995 has included more than 40,000 meters (130,000 ft) of diamond drilling, extensive surface trenching, satellite remote sensing, aerial photography, legal surveying and metallurgical and environmental studies. In excess of 300 line-kilometers of geological mapping, soil and silt geochemical sampling and induced polarization and magnetic surveys have been completed. Nine large IP anomalies were discovered in favourable geological settings and remain untested by drilling.

In January 1998, the Company announced a milestone resource estimate for its most advanced project, the Getty North deposit: 72,093,000 drill-indicated and inferred tonnes averaging 0.31% Cu, including 44.4 million tonnes of sulphidic resource averaging 0.37% Cu and 10.03 million tonnes of oxidized resource averaging 0.40% Cu. Copper can be extracted from the oxidized portion of the deposit by using low-cost heap leaching/solvent extraction and electrowinning (SX-EW) to produce high-quality, premium-priced cathode copper on site. Preliminary metallurgical studies show that leaching the sulphidic resource would yield approximately 65% of the total contained copper, making the use of SX-EW technology potentially attractive for processing the sulphidic portion as well.

At the Getty South deposit, a 50-50 joint venture, in excess of 15,000 meters (49,212 ft) of diamond drilling and 1,775 meters (5,800 ft) of underground development by previous operators allowed an inferred resource estimate of 36 million tonnes of open-pit table oxidized and sulphidic mineralization grading 0.47% Cu, including 719,500 tonnes grading 1.41% Cu.

The Company has identified indications of a possible third deposit in the Getty West-Transvaal zone, a 50-50 joint venture 1.4 km to the southwest of the Getty North deposit which exhibits encouraging IP and geochemical soil anomalies in an area of numerous historic surface showings of copper and reported occurrences of copper and gold in underground workings circa 1900. During the initial drilling program, porphyry copper-style mineralization very similar to that of the Getty North deposit was discovered beneath the area containing the historic prospects, along with traces of gold and silver.

Getty Copper Corp. is fully focused on its main corporate objective: to develop and place into production its Highland Valley open-pit table porphyry copper deposits.

## GETTY COPPER CORP.

### Corporate Address

1000 Austin Avenue  
Coquitlam, BC  
Canada, V3K 3P1  
Tel. (604) 931-3231  
Fax. (604) 931-2814

### Board of Directors

John B. Lepinski,  
*President and CEO*  
Donald Willoughby,  
*CA and CFO*  
Vic Preto,  
*PhD, P.Eng.*  
Jean-Jacques Treyvaud, *PhD*  
William Cummer

Exchange:	TSE, VSE
Stock Symbol:	GTY
Shares Outstanding:	28,610,135
Shares Fully Diluted:	27,848,136
52-Week High/Low:	\$1.20/0.32
Long Term Debt:	\$150,000
