John Kowalchuk

Acreege: 6,000 hectares  
 Commodities: Cu, Au

Agreements Placer Dome purchased 100% of Sulphurets Gold Corp.,  
 the owner of the property.

History

Past Exploration Techniques	By Whom	Amount	Type	Cost
1983-1989	Western Canadian Mining	9,748 m of drilling	geochem, geology, geophysics, diamond drilling	\$4 Million
1990	Placer Dome	14,800 m	diamond drilling	\$3.5 Million

Past Development (if any)	By Whom	Amount	Type	Cost
None				

Past Production (if any)	By Whom	Tonnage(s)	Method	Grade
None				

Reasons for shut-down

Geology

Regional Jurassic Hazelton volcanic and sedimentary package, intruded by Jurassic and Cretaceous monzonite and granodiorite.

Local Lower Jurassic, Unuk River Formation volcanic sediment and tuff. Intruded by Feldspar Porphyry dykes along a strong north-south shear. Mineralization and alteration controlled by the shear.

Alteration/  
 Ore Forming Minerals

Strong phyllic alteration along shear zone. High grade mineralization related to strong silicification and quartz veining. Mineralization consists of pyrite, chalcopyrite, bornite, chalcocite, covellite, native gold.

Current Exploration Results

Reasons for shut-down

Geology

**Regional** Hazelton Group rocks of the Stewart Complex near the western edge of the Bowser Basin and east of the Coast Plutonic Complex have been divided into 5 subunits. All have been intruded by Cenozoic plutonic and subvolcanic intrusive rocks.

**Local** Lower Jurassic Unuk River (of the Hazelton Group) intermediate volcanic flows bound a central sequence of westerly dipping felsic to intermediate pyroclastics that have been cut by 5 dominant north-south trending, westerly dipping faults.

Alteration/

Ore Forming Minerals

Chalcopyrite with lesser chalcocite, tennantite and bornite occur as disseminations and veinlets in a quartz pyrite-sericite schist.

Controls to the mineralization are poorly understood.

## Current Exploration Results

1987-1988

i ) **Geology** An area referred to as the Alteration Zone comprises quartz pyrite sericite schist bounded by fresh intermediate pyroclastic rocks. The Alteration Zone is subdivided into 4 domains by 5 north-south trending faults. Each domain has its own style of alteration and mineralization, the two most important being the A Zone, with high grades of base and precious metals over narrow widths and the B Zone, with extensive porphyry-type copper-gold mineralization.

ii ) **Geochemistry** The Alteration Zone is anomalous for gold, in fact, a contour interval of +700 ppb Au is required to develop trends. Cu, Ag, Pb, Zn also show patterns within the zone but appear to be related to secondary mineralization, downhill migration, or ground water movement. The B Zone high grade mineralization does not have an obvious soil anomaly.

iii) **Geophysics** Induced polarization has been effective in outlining the B Zone copper mineralization. An anomaly of low resistivity, high chargeability (high metal factor) is coincident with the B Zone. The anomaly continues 600 m north of the drilling and is still open. Magnetic surveys and VLF have not been useful in understanding the controls to mineralization.

iv ) **Sampling**

<b>Reserves:</b>	<b>Geological, possible, probable and/or proven</b>	<b>60 million tonnes geological</b>
	<b>Number of zones</b>	<b>1</b>
	<b>Number of sample points</b>	<b>12 drill holes</b>
	<b>Average grade</b>	<b>0.86% Cu 0.342g Au/t</b>
	<b>Average thickness</b>	<b>100 m</b>
	<b>Cut-off grade</b>	<b>0.3% Cu</b>
<b>Costs:</b>	<b>Recent exploration costs, i.e. (relating to above)</b>	<b>\$ 1.0 million</b>
	<b>Projected exploration costs of program to development (if any)</b>	<b>\$ 5.0 million</b>
	<b>Projected development costs given positive economics</b>	<b>\$ 200 million</b>
	<b>Projected operating costs given positive economics</b>	<b>N/A</b>
