NO.186(1988)
SEPTEMBER 27, 1988

WESTMIN RESOURCES LTD. (WMI-V,T) VISIBLE GOLD INC. (VIG-V)

DOVE PROJECT DRILL - A \$750,000 exploration program to PROGRAM PLANNED include 16,000 feet of drilling is planned for the Dove project on the east flank of Mt. Washington, near Courtenay on Vancouver Island, B.C., by the operator, Westmin Resources Ltd., 50% and Visible Gold Inc. 50%. Five principle target areas and a few secondary targets have been selected for drill testing.

The pond area, near the center of the property, contains many, strong geophysical anomalies flanking a Tertiary intrusion and prominent magnetic high. Drilling here last year intersected veined and altered rocks containing geochemically anomalous gold. Mineralized boulders in this area assay up to 0.876 oz.gold/ton.

In the northwest section, an area has been identified that contains both boulders and bedrock occurrences of quartz-sulphide vein, breccia and carbonate altered basalt. Bedrock samples contain up to 6.8 oz.silver/t with anomalous gold. Boulders contain up to 19.8 oz. silver/t, 0.04 oz.gold/t, 5.3% lead and 4.9% zinc.

In the southern sector, a major lineament associated with anomalous gold in soil is flanked by several showings of narrow veins and mineralized faults. Selected grab samples contain up to 0.20 oz.gold/t, 6.53 oz. silver/t and 1.9% copper with associated enrichments in zinc, arsenic, antimony and bismuth.

In the south-central portion of the property, two target areas lie 350m apart on opposite sides of a Tertiary intrusion. On the southwest side, a major fault contains and is flanked by epithermal veining over an exposed width of 100m. Grab samples from individual veinlets returned up to 2350 parts per billion gold, 18.4 parts per million silver, with anomalous copper, lead, zinc, arsenic and antimony. On the northeast side of the intrusion, a soil anomaly in an area of no outcrop contains up to 1165 ppb gold.

The Murex creek showing where a narrow gold intersection was obtained in last year's drill program will also be drilled.

TIGRIS MINERALS CORPORATION(TIG-V)

EARLY DRILLING EXPECTED - Tigris holds a large property AT NICKLE PLATE PROSPECT adjoining to the east the Nickel Plate gold mine of

Corona and Golden North, at Hedley, B.C. Corona holds an option to earn a 70% interest in the property from Tigris by spending \$500,000 on exploration by 31Dec89 and by paying a total of \$100,000 to Tigris. The next and final property payment is \$50,000 due Jan.21,1989. (SEE PROPERTY LOCATION MAP OVERLEAF) Corona has completed a program of soil and rock sampling, geological mapping, detailed geophysical surveys, trenching and drilling. Two of the drill holes cut skarned volcanics with extensive sulphide mineralization and anomalous gold values. In the summer of 1988, over 200 line miles of induced polarization surveys were carried out on the Golden North property and part of the Tigris property. This surveying has confirmed an induced polarization anomaly trending across the Tigris property. This same anomalous areas was indicated by previous work conducted by Placer Dome some years ago. A closer spaced induced polarization survey is now underway to better define drill targets. The indications are that the strong I.P. and soil sample targets located to the west of the Tigris property, on the Golden North property, will be diamond drill tested in October. This target trends onto the Tigris property.

Tigris also holds options to earn a 100% interest in the O.K. Falls property, 2 miles west of Okanagan Falls, 25 miles south of Penticton, B.C. The property option is from Corona which can back-in to a 72% working interest until March 1990 or retain a 10% net profit royalty. Numerous gold showings have been discovered in drill and surface sampling along a quartz carbonate vein within a fracture zone called the Venner main zone. Gold assays in drill core of 1.74 oz.gold/t over 2 meters and at the surface of 0.885 oz. gold/t over 1 meter are encouraging. Tigris will expand the area of exploration north and west of the main grid to seek further gold mineralization in tertiary volcanics. The company is seeking flow-through funding to expand the program on this property and has had an approach from a major company interested in participating in the next phases of exploration.

Tigris shares were called for trading June 29,1988, on the Vancouver Stock Exchange following the sale of 550,000 shares at 35¢ each for gross proceeds of \$192,000 through McDermid St. Lawrence Ltd. There are currently 2,000,600 shares issued of which 400,000 are held by Corona Corp. and 225,000 shares each are held by directors John K. D'Angelo and Gerald D. Angelo. Other directors are: Darrel L. Johnson, geologist, and R.M. Cretain, engineer. Tigris has applied for exempt trading registration in the U.S. and expects clearance in October.

FOOTBALL EXPLORATIONS LTD. (FTW-V)

SLUDGE SAMPLES REPORTED - John W. Carson, president,

reported positive results from exploration on the Hillier-Churchill group of mineral claims located near Zeballos, B.C., in which Football Explorations Ltd. can earn a 51% interest from Falconbridge Limited. Underground exploration on the A-25 gold zone, which has consisted of drifting and raising to one of several high grade diamond drill hole intersections has now confirmed previous assays from diamond drill hole 24-85. Sludge samples from the west side of the raise approximately 41 to 49 feet below surface returned the following values:

from 0 to 4 ft. = 22.58 oz.gold/ton

from 4 to 8 ft. = 10.38 oz.gold/ton

for an average of 16.48 oz.gold/ton

The raise, which knuckles back to the surface, also encountered 20 feet of sulphides. Assays are pending.

Detailed sampling, geological mapping and surveying are being carried out to evaluate these results and determine the best method for continuing underground exploration.

TULLOCK RESOURCES INC. (TLH-V) has signed an agreement, subject to regulatory approval, to earn a 100% interest, subject to a 2.5% net smelter return royalty, in the 64 unit Hen property located in the Quesnel Trough, Cariboo Mining Division, B.C. The company also reports a flow through private placement of \$65,000 to finance the initial exploration program, which will be followed by a drill program later this fall.

IMPERIAL METALS CORPORATION (IPM-V,T,M)

GOLDEN NORTH RESOURCE CORPORATION (GNO-V,T;GNOXF-Nasdaq)

DRILLING PLANNED - Golden North Resource Corporation and AT CARIBOO BELL Imperial Metals are planning an additional 15,000 feet of diamond drilling this year for the Cariboo Bell gold-copper property, 35 miles northeast of Williams Lake, B.C. The program will cost \$750,000. The decision to further test the gold rich mineralization and evaluate the open pit potential of the property was reached following the analysis of the first phase of drilling earlier this year. (SEE GCNL NO.178 p.1 and assay results overleaf p. 2, 15Sep88) The Cariboo Bell property is 38.4% owned by Golden North and 61.6% by the operator, Imperial Metals Group.

CONSOLIDATED ANHAWK ENTERPRISES LTD. (CVK-V) reports the agreement with Pier Mac Resources Inc. for the purchase of quarry equipment will not be finalized.

FENWAY RESOURCES LTD. (FWY-V) reports that geochemical and geophysical surveys have started on the Sue 6, 7 and 8 claims, 30 miles east of Horsefly, B.C. Regional aeromagnetic surveys indicate a number of potential gold-silver targets.
