

SULPHURETS GOLD CORPORATION (SLE-V)

WESTERN CANADIAN MINING CORPORATION (WCD-V)

NEW DRILLING SUGGESTS INCREASED SIZE - The \$1,000,000 exploration program on the Kerr property has begun. The claims are 40 km north of Stewart, B.C. and are 100% owned by Sulphurets Gold which in turn is 74% owned by Western Canadian Mining. Western Canadian is seeking buyer for the 74% of Sulphurets Gold. (SEE GCNL No.63, p2, 3Apr89). Previous exploration discovered 66,000,000 tons grading 0.86% copper, 0.01 oz.gold/ton. Initial results this year indicate the potential size of 150,000,000 tons. Sulphurets also has an option to earn 50% in the adjacent Tedray property.

Geophysical surveying on the Kerr and Tedray properties has now been completed. The high chargeability-low resistivity anomaly that correlates with the high-grade mineralization is now 6,560 ft.long of which 4000 ft. has been drill tested and known to overlie the B zone copper gold deposit. Drilling of the remaining 2600 ft. of the anomaly is expected to increase the deposit.

Five diamond drill holes have been completed with assays awaited. Holes 89-3 and 4 indicate a width increase to 980 ft. an increase of 300 ft. and on increased thickness is also suggested.
