MORE TULSEQUAH ASSAYS - John A. Greig, president, reports Redfern Resources Ltd. has received further assays from the Tulsequah Chief property in NW B.C., 40 miles east of Juneau, Alaska. The project is a joint venture with Redfern holding 40% and Cominco, the operator, holding 60%.

Drilling this year has established the massive sulphides extend to at least 1,650 feet down dip below the lowest mine level, the 5200 level. Of 10 widely spaced drill holes completed this year, nine have intersected massive sulphides with the mineral system showing no signs of diminishing. Grades are increasing with depth. Heavy equipment has been left on site and facilities have been winterized for an early resumption of work next year. Current plans are to extend the 5400 level drift a further 600 feet to the north where new drill stations can be established to continue deeper drilling of the massive sulphide system. Drill indicated geologic reserves are now being calculated. (SEE GCNL Nos. 191, 181, 177, 168, FOR EARLIER RESULTS)
