HOLE	SECTION	DIP DEGREES	INTERVAL FEET	LENGTH FEET	GOLD OZ/T
89-97	13+42N	-80	466.7 - 475.0	8.3	0.224
includes				3.9	.447
89-98	13+42N	-80	492.3 - 497.2	4.9	.022

BRETT DRILLING RESULTS - Stirling McIlveen, president, reports that Huntington Resources Inc. has completed Phase II and is continuing with drilling in phase III of the 1989 work program on the Brett claims near Vernon, B.C. Joint venture partner CORONA CORP. (51%) will not participate in the planned Phase III program. The objective of Phase II was to test three drill intersections on sections 13+11N and 13+75N where Phase I work had revealed gold and silver mineralization associated with a vein/breccia zone near the northern projection of the Main shear zone.

DDH 89-93 targeted an area 120 ft. up dip of 89-92 (3.7 ft. of 1.59 oz.gold/ton). A series of breccia zones were encountered with one returning anomalous gold values. DDH 89-94 and 89-95 both targeted an area 130 ft. down dip of 89-91 (9.3 ft. of .726 oz.gold/t). Both holes were abandoned due to bad ground leaving the downward projection untested. DDH 89-96 targeted an area 230 ft. up dip of the 89-89 intersection (6.4 ft. of .280 oz.gold/t). Several breccia zones were intersected with weakly anomalous gold values indicated. The downward projection of the zone on this section has yet to be tested. DDH 89-97 and 89-98 tested the area between sections 13+11N and 13+75N. DDH 89-97 intersected a mineralized breccia zone containing visible gold. This intersection correlates in depth, position and style of mineralization with that on section 13+11N. DDH 89-98, a 130-ft. stepback hole, targeted the downward projection of the breccia zone and intersected a less altered, weakly gold-mineralized zone.

Results of the drill program are considered to be inconclusive. The structural aspects and the extent of the mineralized zones have not been thoroughly tested.

Huntington plans to conduct a Phase III program to further test this area as well as two other areas: the New Discovery zone and the East zone where 1988 drilling revealed gold over a considerable lateral extent.

The company has acquired by option a 100% interest in a gold prospect near Camp McKinney, east of Oliver in southern B.C. Drilling will begin immediately. Flow through funding is currently under negotiation. (SEE GCNL Nos. 154, 133 & 122 FOR MORE DATA)
