WESTERN CANADIA

SCV-V

**DRAGON RESOURCES LTD. (DGN-V)**

DAVID CLAIMS OPTIONED - Walter J. Clemens, director,  
reports Dragoon Resources Ltd.

has acquired an option to earn an 80% interest in the  
30-claim David property located 19 miles southwest of  
Cranbrook, B.C. and six miles from the company's McNeil  
property. Visible gold has been found in numerous float

samples over a strike length of 650 feet. Assays from  
float samples located near a silicified horizon which  
has been partially sampled due to overburden cover  
assayed up to 8,651 oz.gold/ton. Samples from the  
horizon assayed as follows:

- a) the most northerly sample returned 0.105 oz.gold/ton  
over 3.0 feet.
- b) 30 feet SW of a); assayed 0.20 oz.gold/ton over 6.0  
feet width
- c) grab sample 15 feet SW of b); returned 0.86  
oz.gold/ton
- d) 10 feet west of strike projection and 15 feet of  
sample c); assayed 4.108 oz.gold/ton over 1.5 feet
- e) 30 feet SW of sample d); assayed 0.04 oz.gold/ton

The gold mineralization occurs within a fault zone  
as quartz veins which parallel and cross cut shear  
zones, within a quartz sericite schist which is probably  
an altered diorite and within a pyritic silicified  
turbidite of the Middle Aldridge formation. Trenching  
and sampling of the gold-bearing horizon continues.
