PRIME RESOURCES GROUP INC. (PRU-V)  
STIKINE RESOURCES LTD. (SKZ-V,T)

**MORE VISIBLE GOLD** - William Campbell, secretary, Prime Resources Group Inc., announces visual inspection results of drill holes CA90-645 and CA90-646 at the Eskay Creek Project, a 50/50 joint venture with Stikine Resources Ltd., located about 50 miles northwest of Stewart, B.C. The holes are collared at 0+50M on Section 12+50N, some 100 metres north of all previous drilling on the property as shown on the MAP OVERLEAF PAGE 1.

Hole CA90-645 intersected 98.7 feet of stringer sulphide mineralization comprised of pyrite, galena and sphalerite from 1011.6 - 1110.3 feet. Hole CA90-646, intersected the same horizon approximately 100 metres up-dip. It cut a 15.8-foot interval of similar sulphide stringer mineralization between 811.1 - 826.9 feet that also includes a 3.5-foot section which was noted to contain numerous small specks of visible gold. The stringer mineralization was followed by a 93.8-foot massive sulphide horizon comprised of pyrite, galena, sphalerite, chalcopyrite and tetrahedrite. This was subsequently followed by a minimum 47 feet of similar sulphide stringer mineralization as noted above.

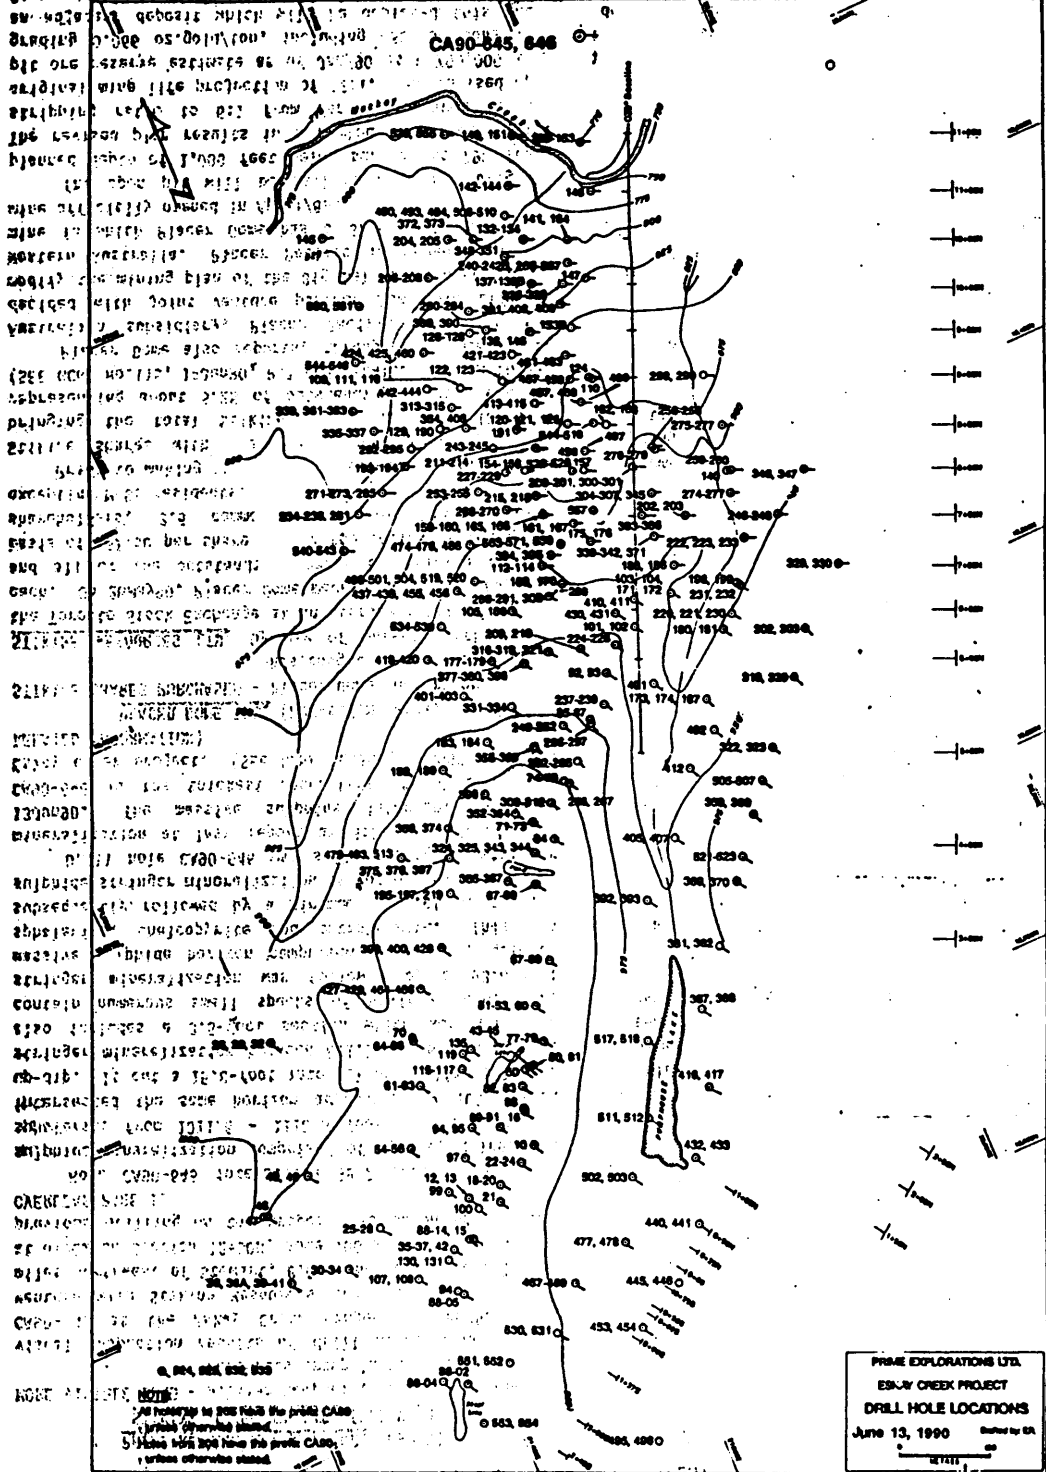

Drill hole CA90-646 was still coring in stringer mineralization at last report at 3:30 P.M. local time 13Jun90. The massive sulphide intercept in hole CA90-646 is the thickest encountered to date on the Eskay Creek project. (SEE GCNL No.108, 5Jun90, P.1 FOR RELATED INFORMATION)
