ADRIAN RESOURCES LTD. (ADL-V)

IMPORTANCE OF NEARBY DRILL HOLES REVIEWED - John S.
Brock,

director has reported Adrian Resources has been advised by Prime Resources of reports of significant sulphide mineralization in drill holes CA90-645 and CA90-646 on the Eskay Creek Project of Prime and Stikine Resources. The holes are collared at O+50W on Section 12+50N, 50 metres south of the boundary of Adrian's Ski Project with the northern border of the TOK 5 and TOK 6 Claims of the Eskay Creek Project. (SEE MAP OVERLEAF and GCNL No.119 for details of recent Eskay Creek results).

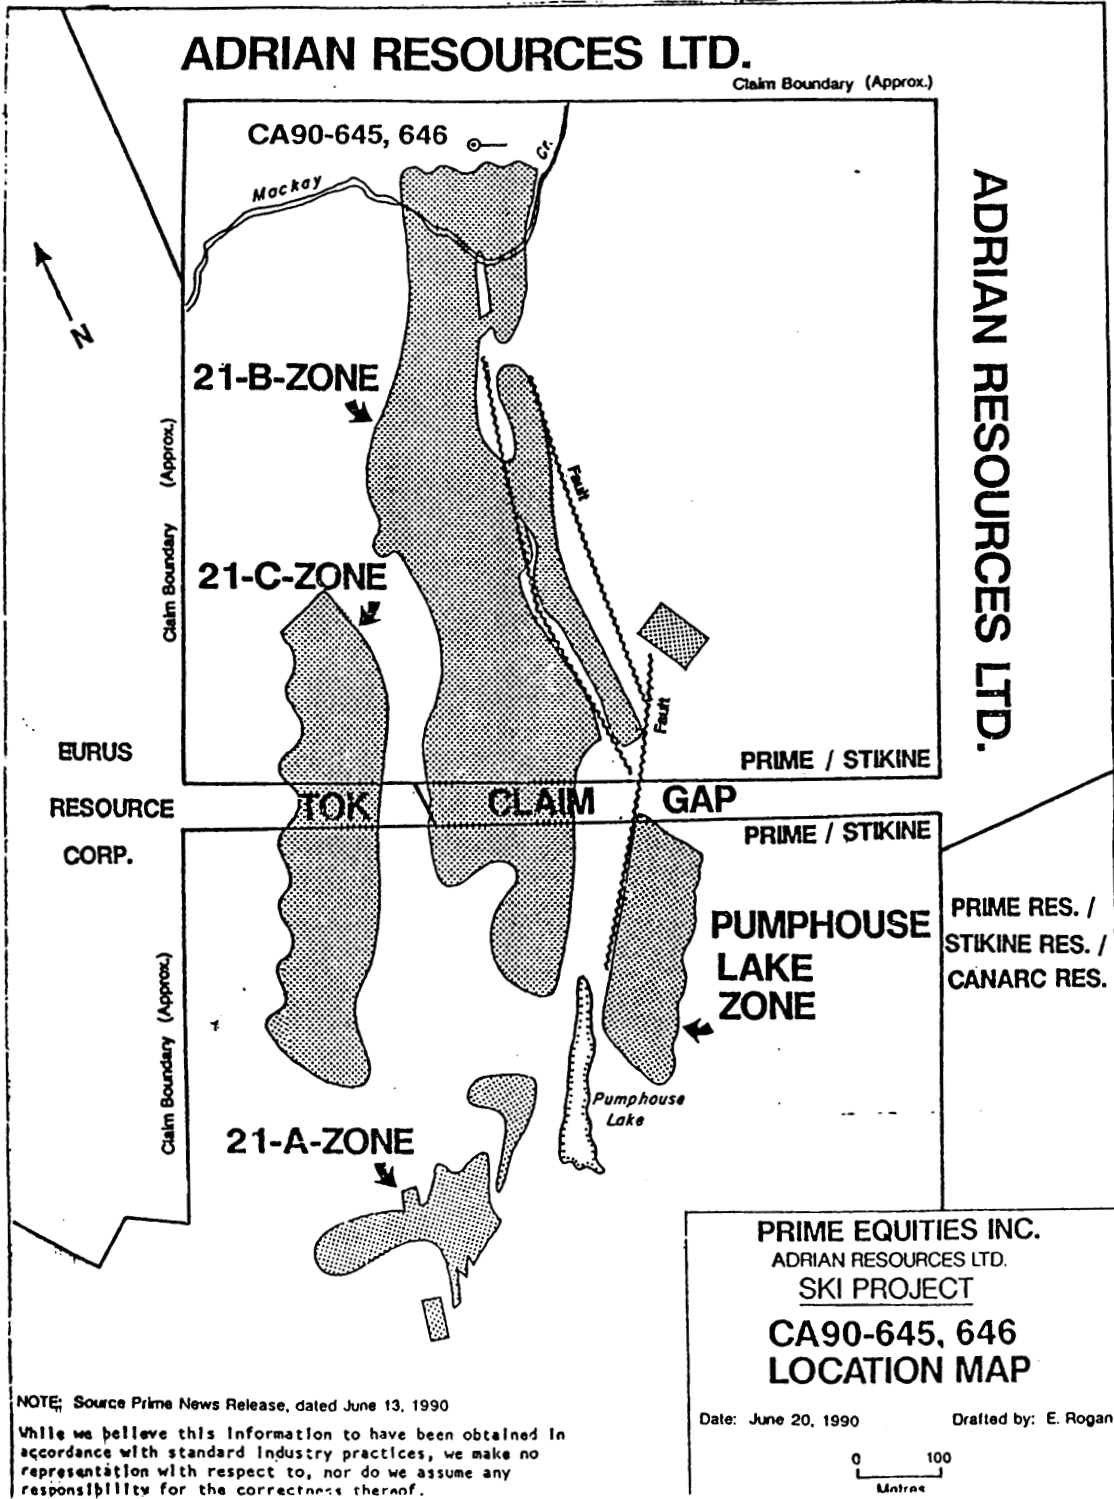

At the June 27 annual meeting, shareholders will

consider approval of an agreement allowing Prime and Stikine the option to earn a 50% in Adrian's Ski Project by spending \$5,000,000 over 4 years, a minimum of \$1,000,000 in the first year, and carry Adrian through a production decision.

The potential extension of the Eskay Creek Deposit onto the Adrian claims has yet to be drill tested, and assays from hole CA90-646 are yet to be reported.
