NEW GOLD ZONES DISCOVERED - Bradford J. Cooke, president, reports Canarc Resource Corp. has received results from the Phase I prospecting program on the Delta property located in the Sulphurets gold camp about 50km NW of Stewart, B.C. Several new gold zones have been identified from geochemical sampling and geological mapping. A total of 941 rock, soil and sediment samples were analyzed geochemically for gold and silver, as well as other trace metals. Anomalous metal values occur in more than 66% of the samples with 14% of the samples returning strongly anomalous to ore-grade gold values. SEE TABLE ABOVE FOR ASSAYS OF GRAB SAMPLES. The zones are narrow, irregular stockworks, veinlets and disseminations of gold-bearing quartz and sulphide minerals including pyrite, tetrahedrite, stibnite, arsenopyrite, chalcopyrite, galena and sphalerite. A Phase II work program of exploration, trenching and drilling has been recommended. Canarc can earn a 60% interest from TEUTON RESOURCES CORP. by paying \$100,000 and spending \$1,000,000 over four years. (SEE GCNL No.43, 1Mar90, P.2 FOR OTHER CANARC EXPLORATION RESULTS)

indicated in 1992. The Pie claims were staked in 1978 to cover lead/zinc showings along the strike of the favourable Gunsteel formation shales, south of the Cirque deposit. A soil sample survey outlined a coincident lead/zinc anomaly 5 km long. No recent work has been done but renewed activity, probably through a farmout to a major, is expected in 1990.
