WESTERN CANADIAN INVESTA

## WILLIAMS CREEK EXPLORATIONS LTD. (WCX-V)

ENCOURAGING GOLD RESULTS - Duane Poliquin, president,  
FROM NEW DRILL PROGRAM Williams Creek Explorations

has reported on the recently completed five hole, 2,600 foot diamond drill program on the 100% owned, Crown granted Westport claims at Wells-Barkerville, 60 miles east of Quesnel, B.C.

These holes were laid out to test the Blackjack adit area, which produced 200 tons of 0.85 oz. gold per ton, the only previous drilling, in 1947, encountered significant values. The veins and zones encountered in drilling are typical of the orthogonal type veins found in the adjoining and formerly producing Cariboo Gold Quartz and Island Mountain mines. Orthogonal oriented veins are the main source of high grade gold in the camp.

NO.	INTERVAL	WIDTH	ASSAY	'
1	59.5-69.0	9.5	0.456	'right angles. Holes 2
	604.25-606.0	1.75	.489	'and 5 are outermost and
	664.5-669.3	4.8	.174	'about 350 feet apart.
2	299.2-301.1	1.9	.107	'Hole 3 (-65 degrees) was
	424.0-437.0	13.0	.250	'drilled at right angles
4	78.8-85.6	6.8	.974	'to the other holes to
	200.0-205.0	5.0	.749	'test a vein intersected
	240.0-244.0	4.0	.395	'in 1947 drilling that

-----'appeared to be in a cross structure, and was reported to contain 9.0 feet of 0.76 opt gold. This vein was cut and contained sulphide mineralization, but returned no significant assays.

The mineralization style, widths and grades are similar to the vein zones mined on the adjacent properties which produced 1,200,000 oz. gold. The drilling has confirmed the potential of the Blackjack zone. The claims have known zones that merit drilling.
