448.0-452.8	4.8	3.0	80.0	7.7	.1	2.9

MORE MYRA FALLS ASSAYS - Bruce McKnight, vice president, corporate affairs, reports

Westmin Resources Ltd. has received assays for the Thelwood Valley surface drill hole PR101 for the second Trumpeter zone drill intersection at the Myra Falls mining operation, west of Campbell River, Vancouver Island, B.C. Two other holes are proceeding to follow up the east and west strike extensions of the Trumpeter zone. The H-W mine 18 level drift being driven toward the Battle and Gap zones has now progressed 325 meters and has 755 meters remaining to the Battle zone. This new drift is serving as a drilling platform for exploring the W37 area and the westward extension of the H-W main lens and the H-W upper zone mineralization. To date, a total of 24 drill intersections have been obtained in this area, which have extended the mineralization 370 meters west of the previously known ore to Section 23+14E. The main lens trend being tested is open further along strike some 1,050 meters to the West into the area south of the Battle lens.

Reserves have not been calculated on these intersections because drilling is only on exploration section intervals (more than 100 meters) and drilling is from a bad angle to get good definition of the lens widths and thicknesses. Indications are that the grade of mineralization is similar to current ore reserves and thickness is averaging about six meters. (SEE GCNL No. 35, 19Feb92, P.2 FOR PREVIOUS DRILL RESULTS)
