JORDEX RESOURCES INC. (JDX-V)

ISLAND COPPER TARGETS TO BE DRILL TESTED- Jodex Resources will start on March 30, 1992, a 12 hole 6,000 foot diamond drill program on the 92 claim Wann property, owned by Acheron Resources, located adjoining to the west of the Island Copper Mine at Port Hardy, Vancouver Island, B.C.

Jordex Resources has an option to earn a 55% interest in the Wann claims.

The program has been designed to test the Island Copper model characterized by a quartz feldspar porphyry dike system intruding the bonanza volcanic sequence. The copper gold molybdenum mineralization is found on both the footwall and hanging wall margins of the dike. A mantle of dumoriterite within an advanced argillic zone caps the zone. The Wann property shows similar sulphide mineralization around a porphyry dike with angular dumoriterite float in the center of the main zone of interest. Jordex Resources has completed induce polarization and magnetometer surveys to cover most of the remainder of the property. Outcrop sampling has returned 2.3% copper, 0.10 opt gold.
