INTERNATIONAL SKYLINE GOLD CORP. [ISC-V,T]
BRONSON DRILLING UNDERWAY - Clifford Grandison, president,
reports exploration of International Skyline Gold Corp.'s Bronson Slope gold/copper porphyry deposit on the Iskut River property in northwest B.C. has begun with the construction of eight drill stations which will be used for in-fill drilling and to prove up additional reserves along strike. Bronson was previously reported to have a drill indicated geological resource in excess of 100,000,000 tons with a proven and probable reserve contained within this larger resource of 40,000,000 tons averaging 0.019 oz.gold/ton and 0.16% copper with silver and molybdenum values resulting in a weighted average \$14.44/ton in gross in-situ contained metal values.

The 3,500 feet of drilling planned for early June is expected to increase the total resource, to delineate proven and probable reserves and to begin to identify a high grade mineable open pit high grade gold and copper intersections will be the target of six closely-spaced drill holes. An extension to the present resource will be the target of two drill holes two km further along strike. The drilling program is scheduled to take about two weeks to complete.

This exploration drilling will take place over a distance which is less than one-half the length of a highly prospective target located in last year's induced polarized survey. The property remains open at depth; however, deep drilling is not planned until the surface expression of the deposit is fully outlined. The Bronson Slope deposit is located near the Cominco/Homestake Snip deposit and is 19 miles away from the Prime/Homestake Eskay Creek deposit. A road to Bronson from Eskay has been subjected to a review process and appears to be feasible. The cost is estimated to be between \$4,600,000 and \$6,000,000 and can be constructed in one season. Skyline plans to make an application for a special use permit for road access on completion of current drilling program.
