GOLDCLIFF RESOURCES CORPORATION

[GCN-V] 2,466,000 SHS.

BC GOLD/SILVER ASSAYS ENCOURAGING - Leonard Saleken,
P. G e o . .

president, Goldcliff Resources has reported gold and silver assays from sampling on the 100% optioned "S" claims in the Kamloops Mining Division, BC. Goldcliff must issue 100,000 shares and spend \$100,000 on exploration over five years, subject to a 2% NSR to earn. The samples are from a quartz-carbonate stockwork zone.

SAMPLE NO.	GOLD GR/T	SILVER GR/T	COPPER PPM
SB 205	0.155	4.4	50
SB 206	.060	1.8	44
SB 207	2.620	114.5	78
SB 208	.455	13.8	52
SB 209	.425	30.6	113

The company acquired the 300-hectare property in Dec. 1995 as a result of a geological data search for gold and silver anomalies associated with porphyry copper deposits. The property is located north of Merritt and southeast of the Highland Valley copper mining district. The area of the claims was explored during the 1960s and 1970s during the Highland Valley and Afton porphyry copper boom. During that time, copper and molybdenum deposits were the focus of economic interest. Up until now, the gold and silver deposit potential of the area has gone untested.

The Goldcliff property is underlain by Nicola Volcanic rocks which have been sheared, altered and intruded by rhyolite porphyries. The gold and silver mineralization is to be related to quartz-carbonate stockwork zone containing mariposite alteration ("green mica"). The extent of the shear-related stockwork zone are not known although indications are the width of the zone exceeds 30 metres.

Sampling by previous owners of the claims of the quartz-carbonate stockwork zone returned gold and silver values as high as:
GOLD: 7.5 GR/T (0.28 OZ/T)
SILVER: 268.4 GR/T (7.6 OZ/T)

Goldcliff plans for an exploration program in early 1996. (SEE GCNL NO.4, 5Jan96, P.7 FOR PREVIOUS PROJECT DATA)
